

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

$$\frac{x^2}{(1-x)^3}y = \frac{C+1}{9(1-x)^3} - \frac{1}{2(1-x)^2} + \frac{1}{(1-x)} + \log K. \sqrt[3]{(1-x)}.$$

Solved similarly by C. A. ISAACS, GERTRUDE McCAIN, and H. L. OLSON.

2793 [1919, 458]. Proposed by J. L. RILEY, Stephenville, Texas.

If a, b, and c, are complex, and α , β , and γ , real constants, the point

$$x = \frac{at^2 + 2bt + c}{\alpha t^2 + 2\beta t + \gamma}$$

traces a conic or a straight line when t takes all real values.

DISCUSSION BY A. F. FRUMVELLER, Marquette University.

Since x is a complex number, let us put x = u + iv, $a = a_0 + a_1i$, $b = b_0 + b_1i$, $c = c_0 + c_1i$, and clear of fractions. Separating the real and imaginary parts of this equation, we obtain the simultaneous set

(1)
$$\begin{cases} t^2(\alpha u - a_0) + 2t(\beta u - b_0) + (\gamma u - c_0) = 0, \\ t^2(\alpha v - a_1) + 2t(\beta v - b_1) + (\gamma v - c_1) = 0. \end{cases}$$

The eliminant is $|p_0q_1| \cdot |p_1q_2| - |p_0q_2|^2 = 0$ (L. E. Dickson, *Elementary Theory of Equations*, New York, 1914, p. 155), where

$$\mid p_0 q_1 \mid = 2 \begin{vmatrix} \alpha u - a_0 \beta u - b_0 \\ \alpha v - a_1 \beta v - b_1 \end{vmatrix}$$

= 2 $[(\alpha b_0 - a_0 \beta)v + (a_1 \beta - \alpha b_1)u + (a_0 b_1 - a_1 b_0)]$ with similar expressions for the other two determinants.

The eliminant is, therefore, a quadratic in (u, v), i.e., a conic, which under suitable conditions degenerates into straight lines. This conic in the plane uov (the plane of the complex number x) is in reality the projection of the actual path of the moving point in space as it spirals its way around the axis of t or a parallel line standing out at right angles to the lines \overline{ou} , \overline{ov} , in the x-plane.

Cf. an article on "The graph of f(x) for complex numbers" (this Monthly, 1917, 409), where many analogous examples are worked out and graphed in this rather unusual system of coördinates.

Also solved by ARTHUR PELLETIER.

2796 [1919, 458]. Proposed by N. P. PANDYA, Amreli, India.

Construct a triangle ABC having its centroid on a given ellipse, AB being a fixed diameter of the ellipse and C lying on one of the directrices.

SOLUTION BY GRACE M. BAREIS, Ohio State University.

Let O be the center of the given ellipse. Construct OM perpendicular to a directrix and meeting it at M. Determine P on OM so that $OP = \frac{1}{3}OM$. Through P draw a line parallel to the directrix and cutting the ellipse in N_1 and N_2 . Draw ON_1 and ON_2 meeting the directrix in C_1 and C_2 , respectively. Then ABC_1 or ABC_2 is a solution. It is to be noted that the points C_1 and C_2 are fixed points whatever diameter AB may have been chosen. The problem has four solutions, two corresponding to each directrix, if $e > \frac{1}{3}$; two solutions, one corresponding to each directrix, if $e = \frac{1}{3}$; no real solution when $e < \frac{1}{3}$.

Also solved by E. J. Oglesby, H. L. Olson, and Arthur Pelletier.

2797 [1919, 458]. Proposed by E. J. OGLESBY, New York University.

Solve for x and y, the simultaneous equations,

$$x^3 + y^3 = 35$$
 and $x^2 + y^2 = 13$.
